1 Application

- Pressing the pause and resume button while running can take a long time.
- The user needs to wait if he/she is switching too fast between the profile and history page.
- The average speed is too low in comparison with the amount of kilometres and time ran.
- If the user logs in for the very first time on a new device, loses internet connection within 2 seconds after log-in and goes to the Profile tab before internet connection is reestablished, his aggregated running statistics might be reset.

2 Server

- The user needs to regenerate a new route if the route is the same from the old one, or when the route is not nice enough (e.g. too much pikes in it).
